

ABSTRACT OF DISCLOSURE

A high hat stand keeps high hat cymbals straight on a floor, and crashes the top cymbal against the bottom cymbal in response to player's footing, wherein a toggle joint is connected between an extension rod connected to the top cymbal, a foot board depressed by the player and a stationary frame so as to achieve a large magnification ratio between the force exerted on the foot board and the force exerted on the extension rod, thereby improving the response to the player's footing.
